ABSTRACT: Phytocomponents in methanolic extract of Euphorbia hirta, leaf was studied using GC MS analysis. Ten compounds were identified from the extract. The major chemical constituents were Niacin or Nicotinic acid [Peak area: 31.70% ; RT: 22.718; Mol formula:C₆H₇NO₃]; S-methyl-L-cysteine [Peak area: 18.88% ; RT: 21.794; Mol formula:C₇H₁₂NO₂S]; Methyl 1,4-methylpentadecanoate [Peak area :11.22% ; RT: 19.326; Mol formula:C₁₇H₃₆O; 2-amino-3-sulfanylpentanoic acid [Peak area : 5.16% ; RT: 21.682; Mol formula:C₆H₁₄NO₂S]; 4-amino-4-oxobut-2-enoic acid [Peak area: 4.02% ; RT: 23.118; Mol formula:C₃H₇NO₃]. The bioactive compounds in the methanol leaf extract of Euphorbia hirta, exhibited phytopharmacological significance and hence could be beneficial for therapeutic use against some health challenges.

Keywords: GCMS, Euphorbia hirta, Asthma plant, Hallucination; Nicotinic acid.

I. INTRODUCTION

Euphorbia hirta is an annual hairy plant with many stems and branches from the base to top that is reddish or purplish in colour [1]. It belongs to the plant family Euphorbiaceae. It is a pantropical weed, known to be native in India. It is found commonly in grassfields in Ohafia town in Nigeria. It grows in open grasslands, roadsides and pathways and widely used as a medicinal herb [2]. Its common names are asthma plant, hairyspurge [3]. It is an annual herb that grows erect with a hairy solid stem that produces white latex or milky juice in abundance, which can be used as arrow poisons [4]. It has simple leaves that are elliptical and hairy on both surfaces. The leaves grow as opposite pairs on the stem and flowers are found on each leaf node. The fruit occurs in capsules producing tiny, oblong, four-sided red seeds. Other species of Euphorbia are useful in traditional medicines with Euphorbia hirta possessing pharmacological properties against bacterial activity like Escherichia coli, Staphylococcus aureus, Pseudomonas aeruginosa; and Bacillus subtili [5], anthelmintic effect, antioxidant effect [6] antiasthmatic and sedative effect, antispasmodic, anti fertility effect [7], anti inflammatory effect [8, 9] anti fungal activity against plant pathogens Colletotrichum capsici, Fusarium palldoroseum, Botryodiplodia theobromae, Phomopsis caricae-papayae; and Aspergillus niger using the paper disc diffusion technique.[10] and antimalarial properties.[11] It is widely used as a medicinal plant and commonly called asthma plant or asthma herb [11]. Pill bearing spurge, garden spurge or pill pod sandran in English [3]. In the milky latex of Euphorbia hirta there are also some phytochemicals like sterols, alkaloids, tannins, quercetin, glycosides, triterpenoids, alkene phenolic acids, choline and shikimic acid [12]. It is traditionally used to treat conjunctivitis ulcerated cornea, asthmatic bronchitis, intestinal disorders, syphilis and to increase the milk flow in lactating women [13]. The aqueous extract of this plant exhibits analgesic, anti pyretic and anti inflammatory activities which can be used in the treatment of swellings, boils, eyelid stress, and cancer growth [13]. The methanolic extract of the leaves have antifungal and antibacterial activities. Roots are also used for snake bites. The ethanol extract of the whole plant showed hypoglycaemic activity in rats and also a sedative effect on the genitor-urinary tract [2, 13, 14]. The present research was carried out to determine the phytochemical components in Euphorbia hirta by GC-MS analysis. Recently, interest for the characterization of organic compounds in plants has increased. Therefore, the research is to screen and isolate the bioactive compounds, evaluate the pharmacological potentials and characterize them by GC-MS analysis.
II. MATERIALS AND METHODS

A Plant Materials
Fresh leaves of *Euphorbia hirta* was harvested at Ohafia town in Abia State, Nigeria. The plant leaves were identified by Prof M C Dike at the Taxonomy section of College of Natural Resources and Environmental Management, Michael Okpara University of Agriculture, Umudike, Nigeria.

Figure 1 shows picture of *Euphorbia hirta* harvested in Ohafia town in Nigeria

B Preparation of Plant Extract
The plant material of *Euphorbia hirta* was collected from open grassland, shade dried for 10 days and pulverized to powder using mechanical grinder. The plant extract was prepared using Soxhlet method as described by [15]. Thirty grams (30 g) of powdered sample was introduced into the extraction chamber of the Soxhlet extractor using methanol as solvent. Temperature was maintained at 75°C throughout the extraction period of 48 hrs. At the end of the extraction period, the extract was concentrated using oven at 35°C to obtain dried extract which was sent for GCMS analysis.

C GCMS analysis of *Euphorbia hirta*
The characterization of the Phytochemicals in *Euphorbia hirta* was done using GC-MS QP2010 Plus (Shimadzu, Japan). The identification of the phytochemicals in the sample was carried out using a QP2010 gas chromatography with Thermal Desorption System, TD 20 coupled with Mass Spectroscopy (Shimadzu). The ionization voltage was 70eV. Gas Chromatography was conducted in the temperature programming mode with a Restek column (0.25 mm, 60 m, XTI-5). The initial column temperature was 80°C for 1min, and then increased linearly at 70°C min⁻¹ to 220°C, held for 3 min followed by linear increased temperature 10°C min⁻¹ to 290°C for 10 min. The temperature of the injection port was 290°C and the GC-MS interface was maintained at 290°C. The sample was introduced via an all-glass injector working in the split mode, with helium carrier gas low rate of 1.2 ml min⁻¹. The identification of compounds was accomplished by comparison of retention time, peak area percentage and fragmentation pattern, as well as with mass spectra of the GC-MS.

D Identification of Phytocomponents in *Euphorbia hirta*
GC-MS Chromatogram of *Euphorbia hirta* revealed eight peaks showing that eight different compounds were present. Identity of the active components in the extract was done by comparison of their retention indices, peak area percentage and mass spectra fragmentation pattern with those stored in the database of National Institute of Standards and Technology (NIST) and also with published literature, NIST08.LIB [16], WILEY8.LIB [17], PESTEI-3.LIB and FA-ME.LIB library sources were used for matching the identified components with the plant material. From there, the name, molecular weight, formula, structure and bioactivities of the compounds were ascertained.

III. RESULTS AND DISCUSSION

A Results
GCMS chromatogram of the methanol extract of *Euphorbia hirta* (Figure 2) showed ten peaks which indicated the presence of ten major phytochemical constituents.

**B Discussion**

The chromatogram of *Euphorbia hirta* showed ten peaks indicating the presence of ten major compounds. Shown in table 1, Catechol-O-Methyl Transferase (COMT) is an enzyme that catalyses the breakdown of catecholamine forming homovanillic acid, nor metanephrine and metanephrine depending on the substrate. [18]. The phytocompound methyl-4-methylpentadecanoate [RT: 19.326, Peak Area: 11.22%, Molecular formula: C_{18}H_{35}O_{2}] showed inhibitory activity against COMT which may lead to an accumulation of catecholamine. Methyl transferase is any enzyme that catalyzes the transfer of a methyl group from a donor to an acceptor. [19] Catecholamine is a group of sympathetic-mimetic amines (dopamine, adrenaline and nor adrenaline) with aromatic portion whose molecule is catechol. The release of catecholamine at sympathetic nerve ending increases the rate and force of muscular contraction of the heart, thereby increasing cardiac output, constricts peripheral blood vessels, resulting in elevated blood pressure and also promotes an increase in blood lipids by increasing the catabolism of fats. [20] Arachidonic acid inhibition activity demonstrated by Hexadecanoic acid at [RT: 19.937, Peak area: 4.12%, Molecular formula: C_{16}H_{33}O_{2}] by GCMS screening shows that the compound could be useful in the regulation of prostaglandin, leukotrienes and thromboxane production. S-methyl-cysteine at [RT: 21.794, Peak Area: 18.88%, Molecular formula: C_{6}H_{12}N_{2}O_{2}S] was the second most abundant compound in the extract and showed 12-Lipoxygenase and 5-Lipoxygenase inhibition activity. It showed also anti-low density lipoprotein (anti-LDL). The phytocompound could therefore be useful in checking the production of LDL by inhibiting lipoxygenase, an enzyme involved in the synthetic pathway of arachidonic acid to leukotrienes and thromboxane. S-methyl-L-cysteine had activity of inhibiting 1,2-lipoxygenase, 5-lipoxygenase therefore can inhibit the production of thromboxane and leukotrienes. Lipoxygenase (LOX) is an enzyme found in the lungs, platelets and white blood cells; involved in the arachidonic acid cascade leading to the production of leukotrienes and lipoxins. [21] The most abundant compound in the extract was niacin or nicotinic acid [RT: 22.718, Peak Area: 31.70%, Molecular formula: C_{6}H_{14}NO] which showed anticancer and antidiote for organophosphates. Nicotinic acid being the highest at retention time of 22.718 and peak area of 31.70%, molecular formula C_{5}H_{11}NO_{2} had bioactivity of reducing the risk of cardiovascular disease and for treating pellagra [22,23]. One of the interesting things in this *Euphorbia hirta* extract is in the compound 4-amino-4-oxobut-2-enoic acid [RT: 23.118, Peak Area 4.02%, molecular formula C_{6}H_{12}NO_{2}] and 2-amino-3-sulfanlypropanoic acid [RT: 21.682, Peak Area 5.16%, molecular formula C_{6}H_{11}NO_{3}S] could inhibit uric acid production, therefore could be useful in the control of gout. Inhibition of production of uric acid means control of gout. Gout is a disorder of uric acid metabolism in which there is hyperuricemia and deposition of urates in and around the joints leading to a severe pain. This condition which can only be controlled by allopurinol can now have a phytochemical remedy. Allopurinol is a structural analogue of purine that directly inhibits xanthine oxidase [24]. The inhibition of uric acid production by 2-amino-3-sulfanlypropanoic acid may be as a result of inhibition of xanthine oxidase. The compound 4-amino-4-oxobut-2-enoic acid also showed increase in aromatic amino acid decarboxylase activity which is associated with increase production of useful amines, for example, decarboxylation of tyrosine will yield adrenaline while that of tryptophan will yield 5-hydroxytryptamine (Serotonin). The phytocompound 4-amino-4-oxobut-2-enoic acid showed a bioactivity of increase decarboxylase activity of the aromatic amino acids which may result in increased production of serotonin and adrenaline. Serotonin is an inhibitory neurotransmitter that plays a role in regulating pain sensory perception, eating, sleep and body temperature. It has also been related to hallucinations and psychosis. [25] In times of acute stress, adrenaline is released into the blood. Adrenaline is an emergency hormone and an integral for fight, flight, and fright syndrome. The release of adrenaline speeds up coronary blood flow and heart rate among other effects; oxygen supply to the heart is diminished because adrenaline causes the bronchi to dilate; thus it could be used to treat asthma. [11]. Of the estimated half a million species of plants about 150 have been used for hallucinogenic purposes [26]. At retention time of 22.215 and Peak Area % of 3.65, the phytocompound 2,3,5-trimethyl-1-H-pyrole indicated hallucinating and anti-HIV integrase activity. Therefore the compound is capable of producing false sensory perceptions and can act by not allowing the integration of the HIV virus into the host cell.

**IV. CONCLUSION**

The results revealed that Phytocompounds obtained from the *Euphorbia hirta* methanol leaf extract contain ten bioactive compounds in their various concentrations. The major components were Nicotinic acid 31.70%, followed by S-methyl-cysteine 18.88%, and Methy 14-methylpentadecanoate 11.22%.
V. Acknowledgment

We are grateful to National Research Institute for Chemical Technology [NARICT], Zaria, Nigeria, for running the GC-MS analysis and Mrs Rose Sangodare for her effort to safe guard the sample for accurate result.
